

$Z_{\text{vtx}} < 10$ cm EMCal Simulations

Joe Osborn

UMich

6/8/17

Overview

- Look at single particle simulations with $z_{\text{vtx}} \pm 10\text{cm}$
- Can compare to previous simulations with $z_{\text{vtx}}=0$
- Can also test any correlations that position dependent recalibration has
 - If no correlations, should work on the $z_{\text{vtx}} \pm 10\text{cm}$ data since this is a completely independent set of simulations

Comparison with $z_{\text{vtx}}=0$ cm (No position dependent correction)

Photons, $z_{\text{vtx}} \pm 10$ cm

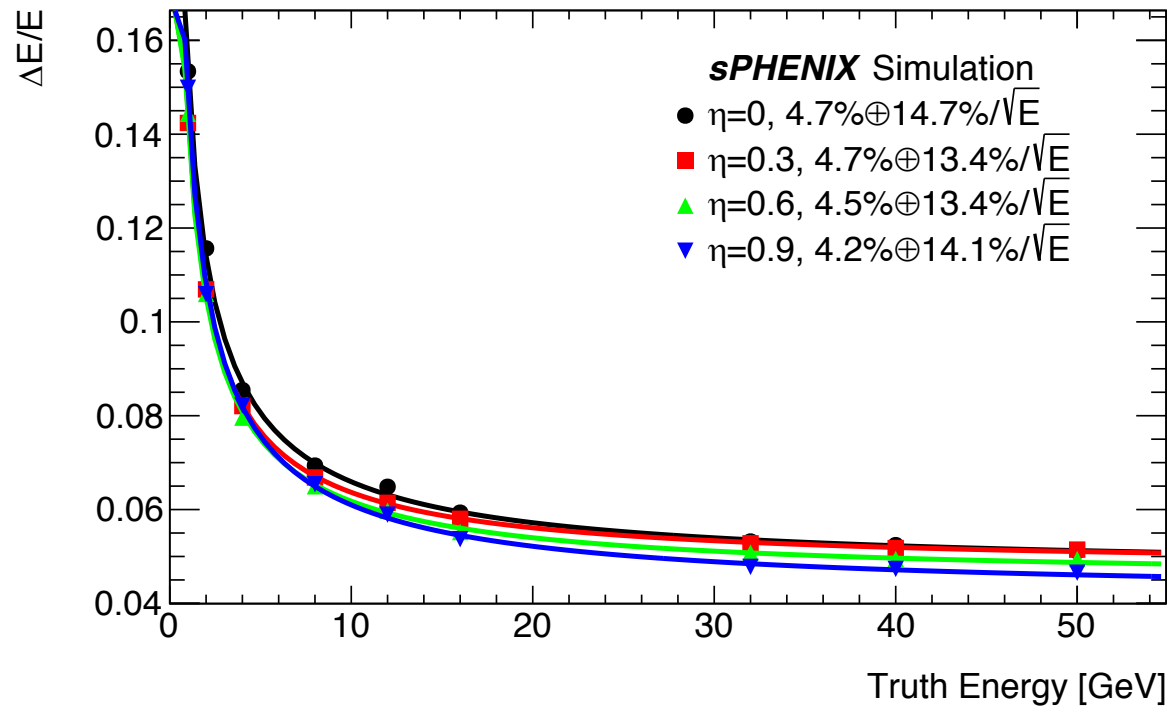

Photons, $z_{\text{vtx}} 0$ cm

No real difference in resolution fits

Comparison with $z_{\text{vtx}}=0$ cm (With position dependent correction)

Photons, $z_{\text{vtx}} \pm 10$ cm

Photons, $z_{\text{vtx}} 0$ cm

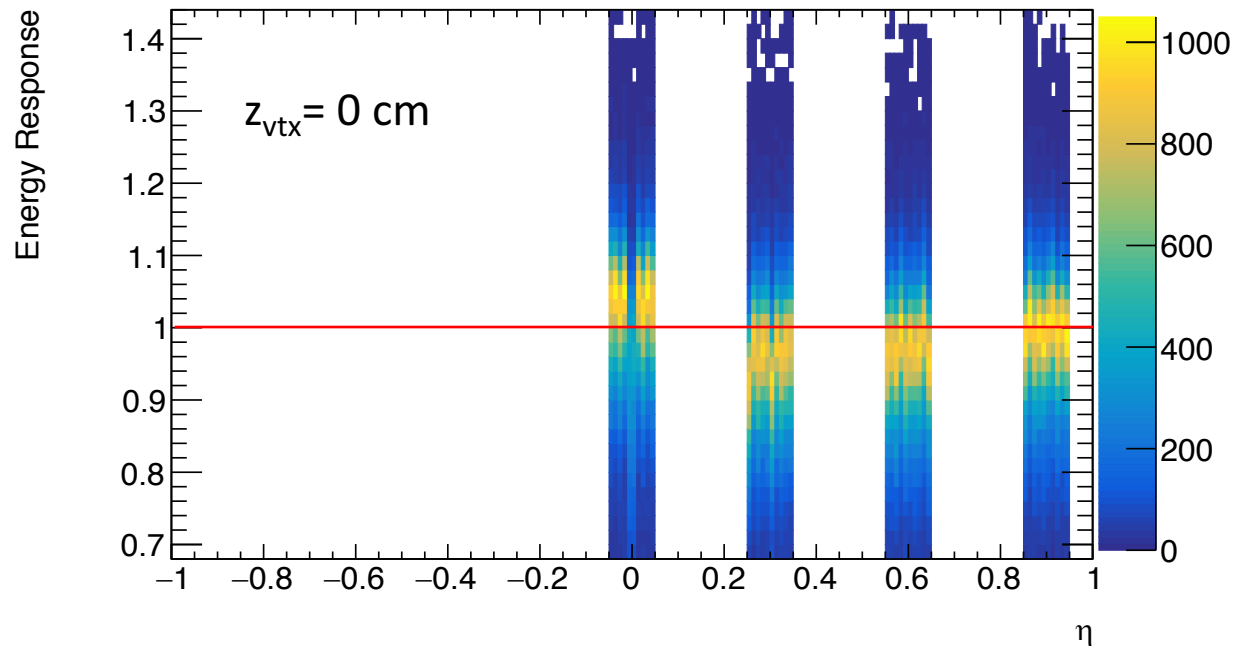

No real difference in resolution fits

Pause For Conclusions

- The position dependent correction works well on the $z_{\text{vtx}} \pm 10$ cm simulations
- Therefore the correction does not suffer from self-correlations since these are completely independent "data" sets
- $z_{\text{vtx}} \pm 10$ cm simulations show nearly similar behavior to $z_{\text{vtx}} = 0$ cm when looking at the resolutions

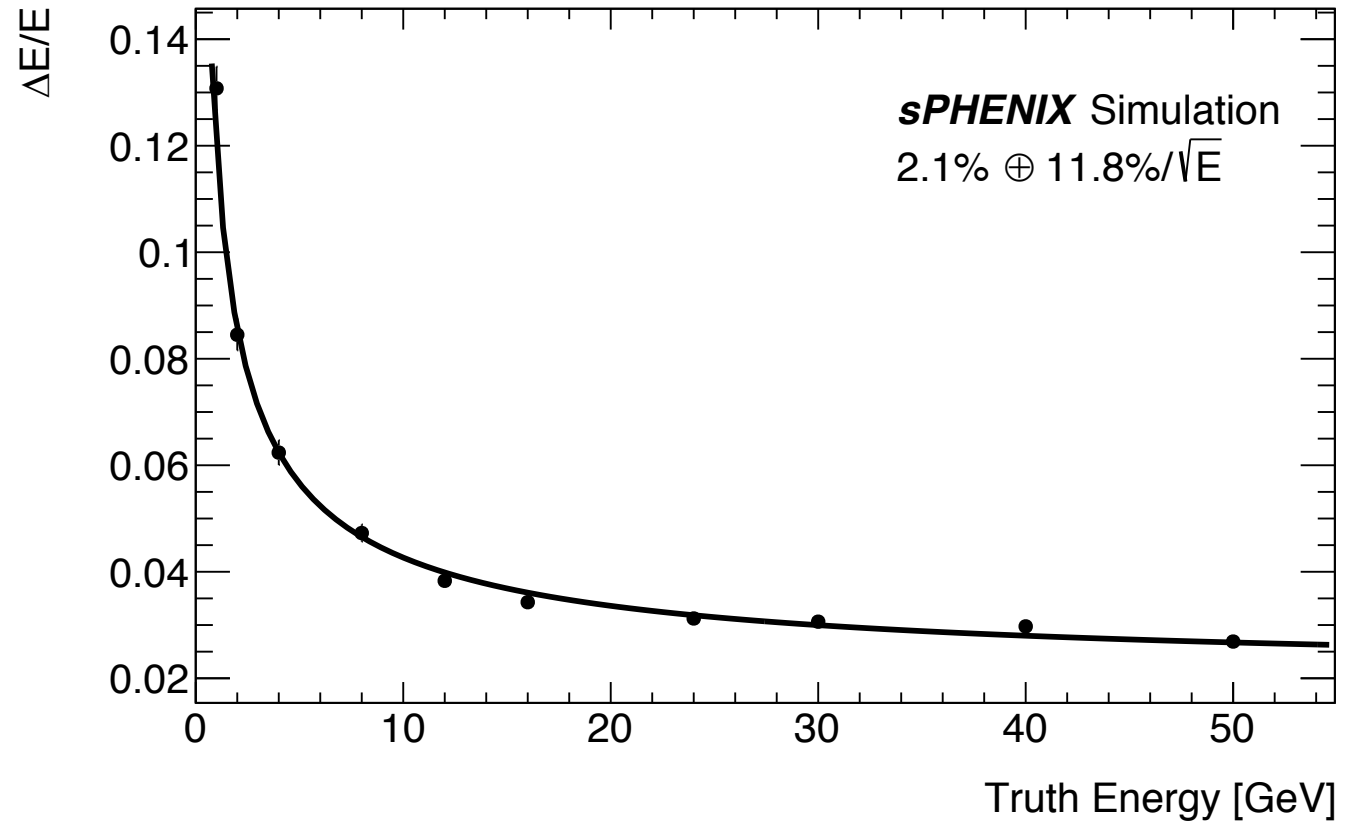

Energy Response

- Saw from Dennis last week that new SPACAL has energy response difference at $|\eta| < 0.15$ than elsewhere due to 1D vs. 2D projectivity
- $z_{\text{vtx}} \pm 10$ cm data shows similar behavior. Will need to do a tower-by-tower calibration
- One thing to note is that response at exactly $\eta=0$ is better as expected when z_{vtx} is smeared out

Perfect Single Tower Simulation

- Simulate photons with beam pipe and EMCal only, fire photons at center of one 2D SPACAL tower with 100% light efficiency
- Same as last week but with 100% light efficiency
- Reduces constant term to 2%

New EMCal Resolution Comparisons

- 1 perfect tower simulation, $11.8\%/\sqrt{E} \oplus 2.1\%$
- Position uncorrected, $\eta=0$
- Position uncorrected, $\eta=0.3$
- △ Position uncorrected, $\eta=0.6$
- ▽ Position uncorrected, $\eta=0.9$
- Position corrected

Conclusions

- Single particle EMCAL simulations look stable across z_{vtx}
- Position dependent correction works well for independent data set
- Tower-by-tower calibration is necessary to account for 1D vs. 2D projectivity in $|\eta| < 0.15$ and $|\eta| > 0.15$
- Perfect EMCAL simulation with 100% light efficiency pushes constant term down to 2%
