

# EMCal Divider Study

Joe Osborn  
UMich  
11/15/17

# Overview

- Reminder: Last few weeks Jin submitted pull requests which allows us to adjust divider width and material in simulation
- Performed single particle simulations with various divider materials
- Simulation setup:
  - Electrons or positrons at 5 GeV, photons at 20 GeV in  $p_T$
  - $0.4 < \eta < 0.5$
  - $0.2 < \phi < 0.4$  (1 sector)

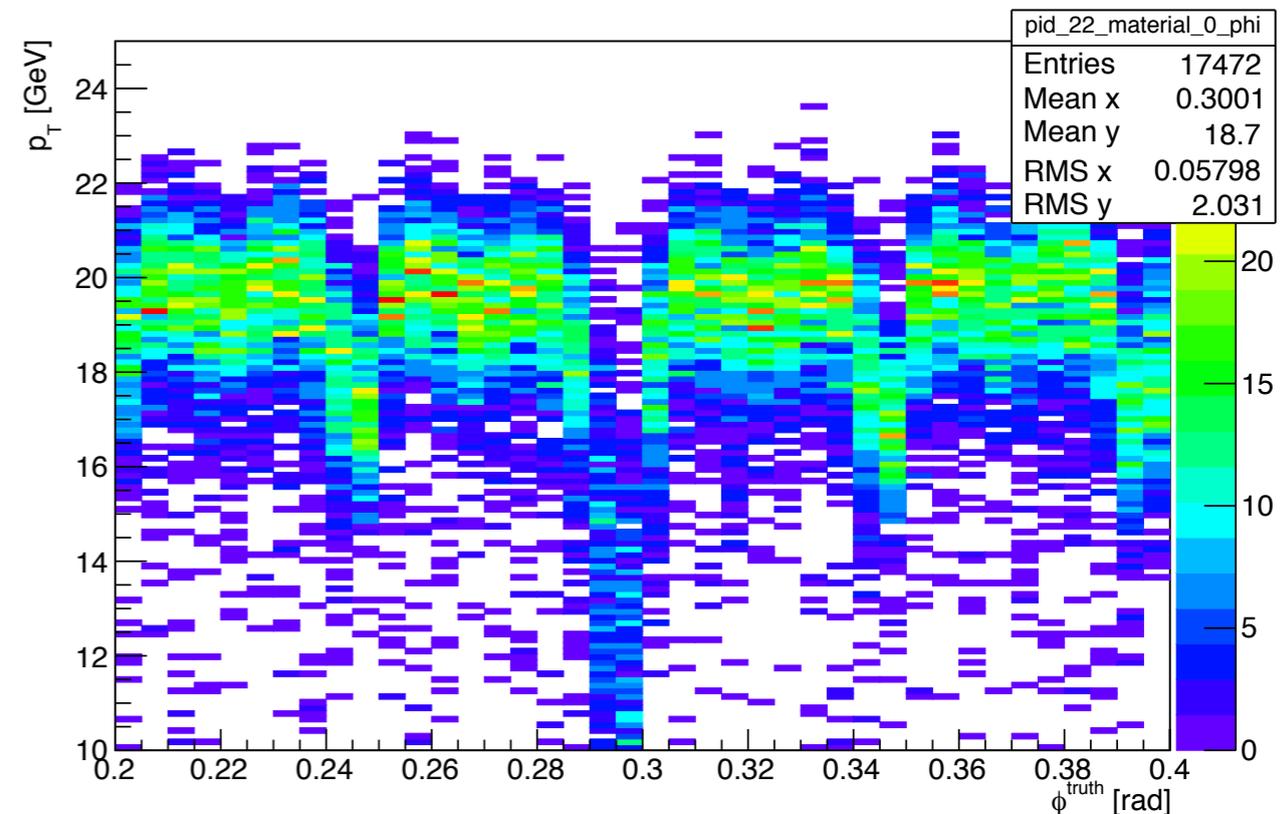

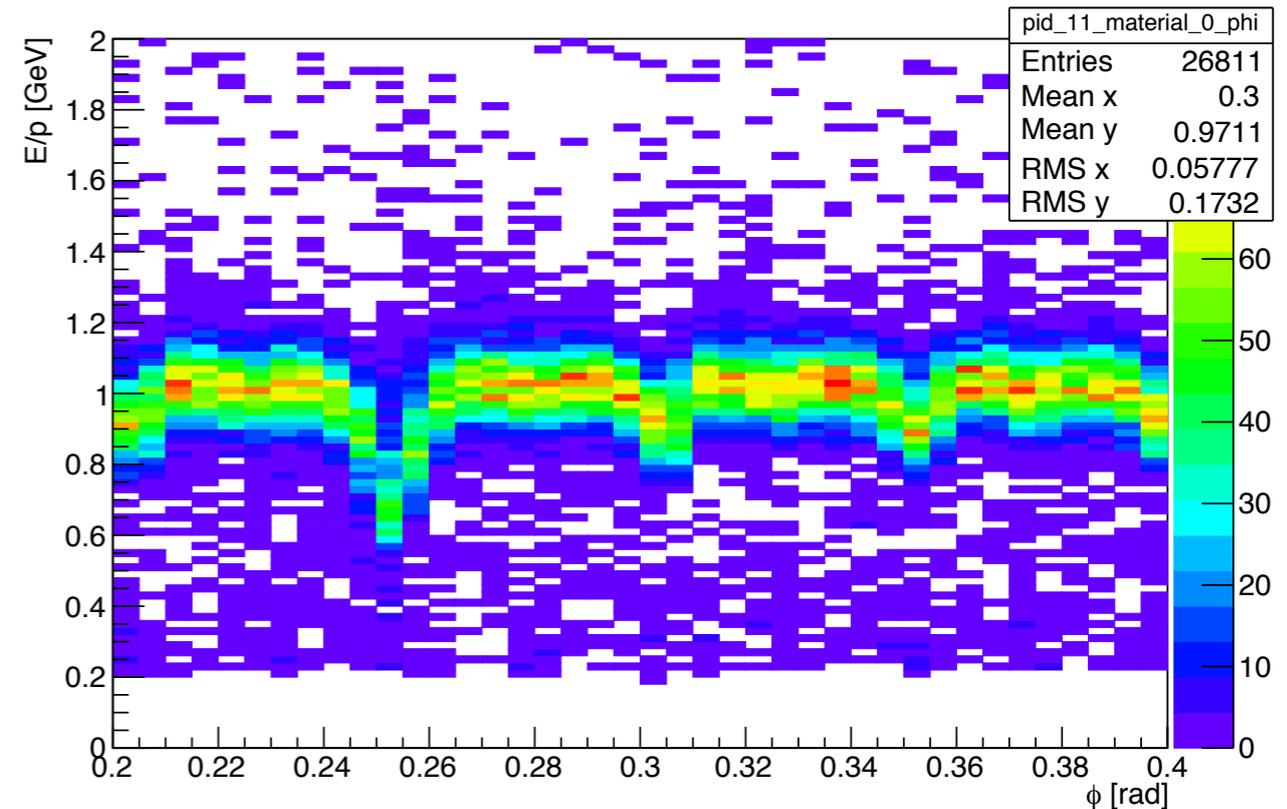

# Example DSTReader Plots Showing Divider Hits

$$0.2 < \phi < 0.4$$

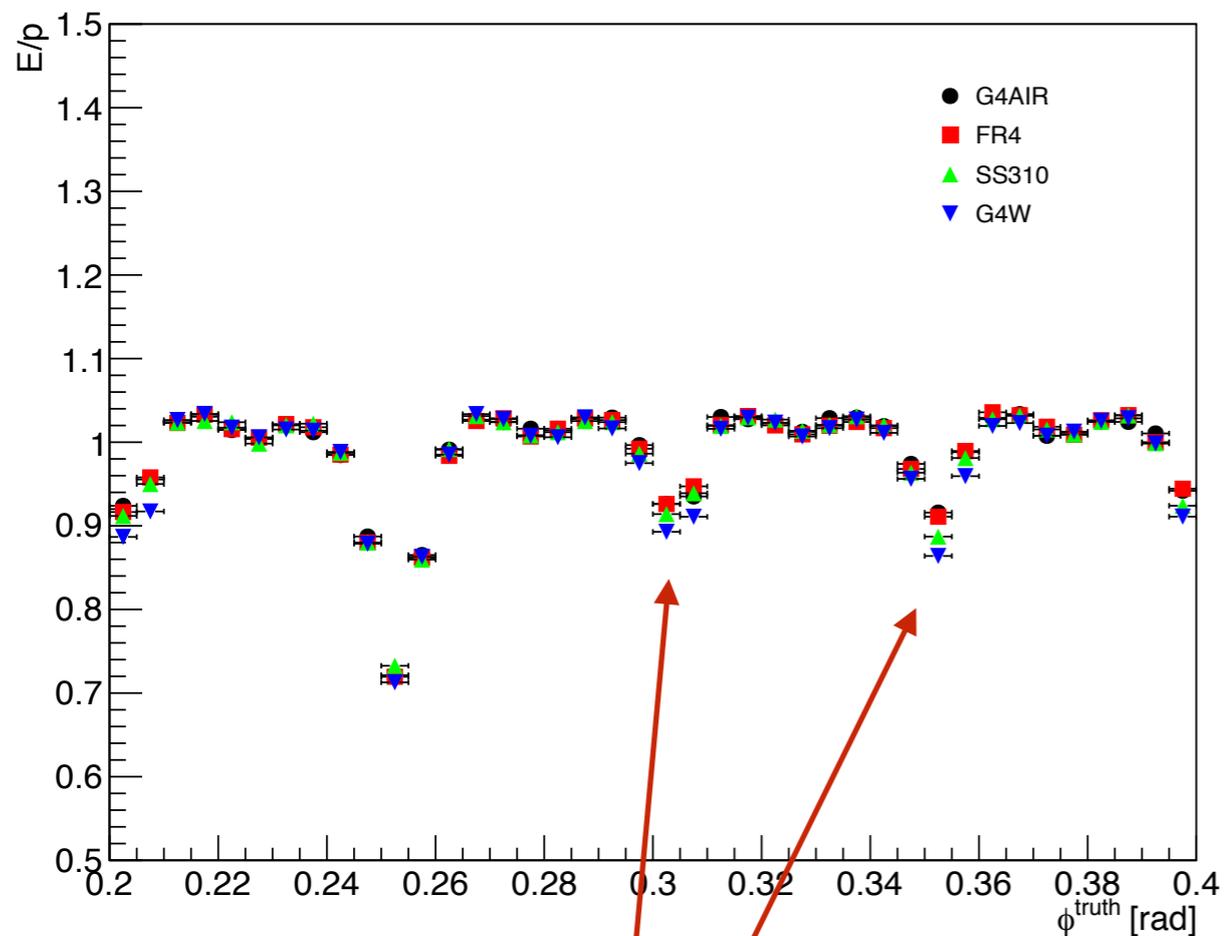

# Example Energy Response

- Example energy response for 5 GeV electrons (top) or 20 GeV photons (bottom) in G4AIR
- This is without the position dependent energy recalibration
- Fit each slice with a Gaussian and plot the mean energy responses as a function of particle and divider material (G4AIR, FR4, SS310, G4W)

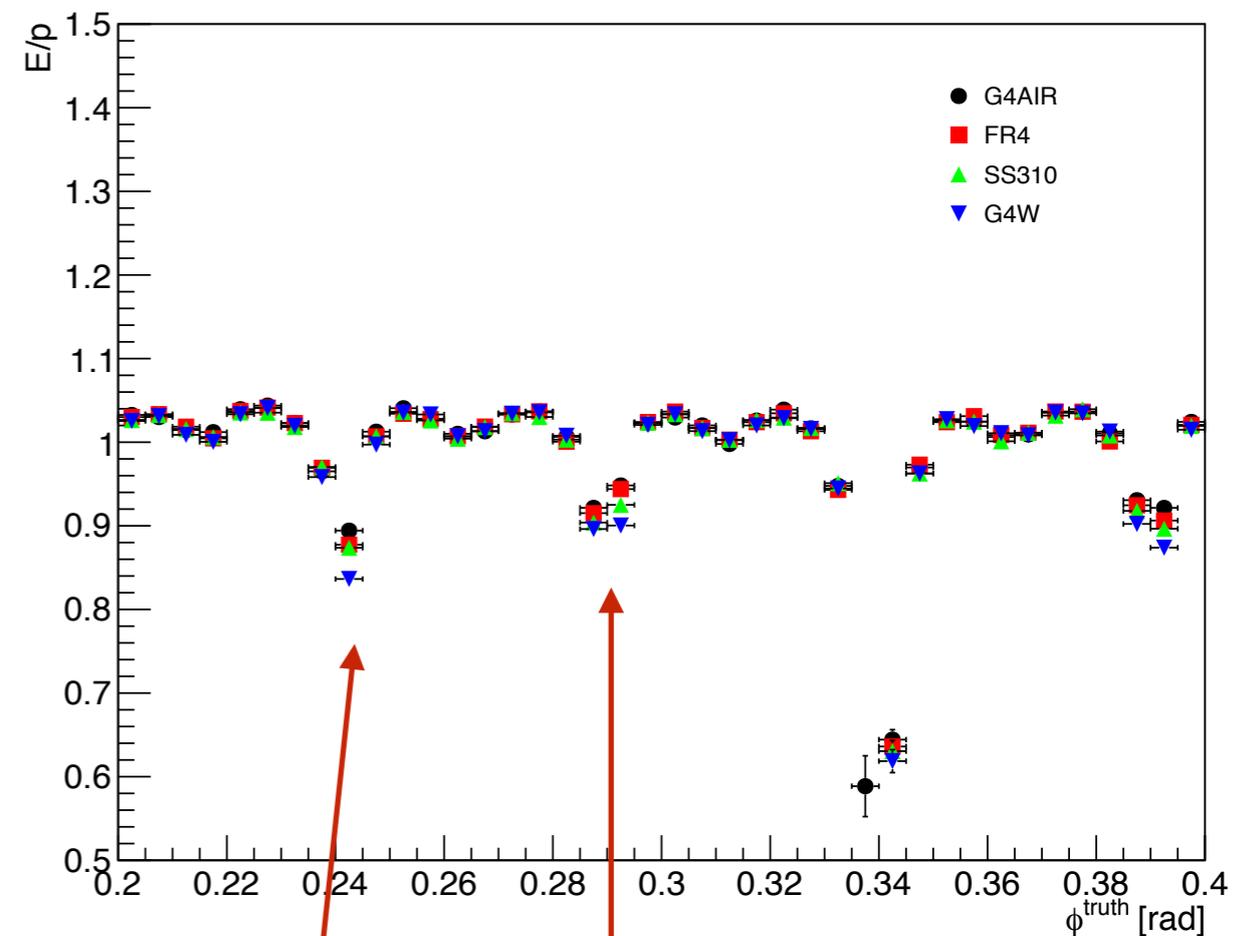

# Energy Responses as a Function of Material

Electron

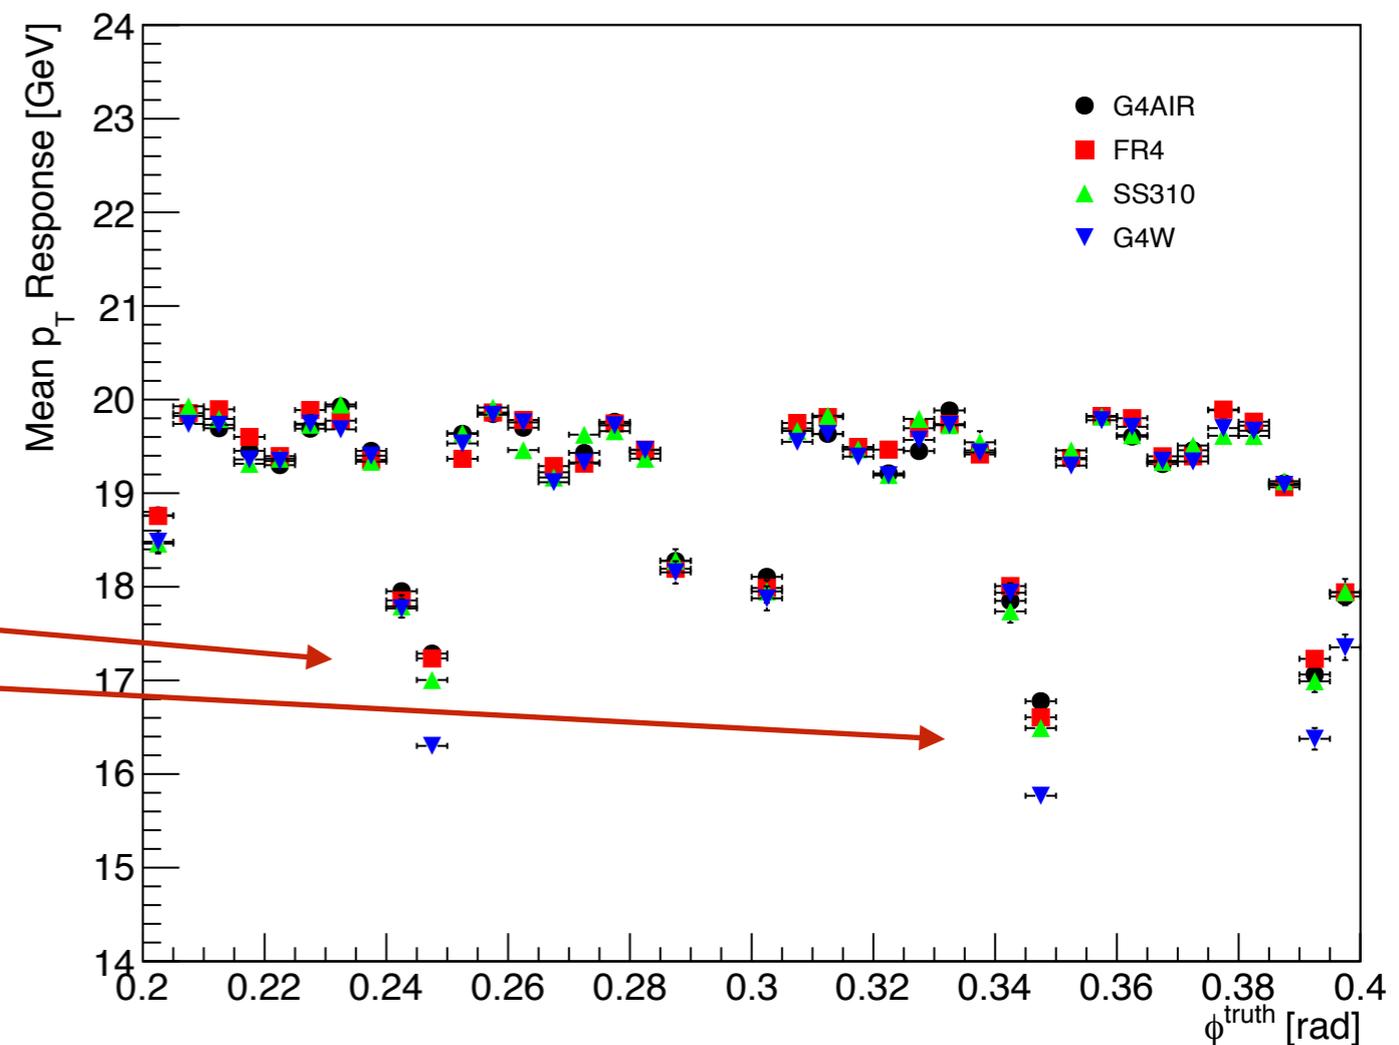

Positron

- There is some indication of a material dependence in between blocks, but it appears to be small

# Photon Response

- Clear material dependence in the photon response
- Significant drop off when using G4W
- AIR, FR4, and SS410 are all reasonably similar

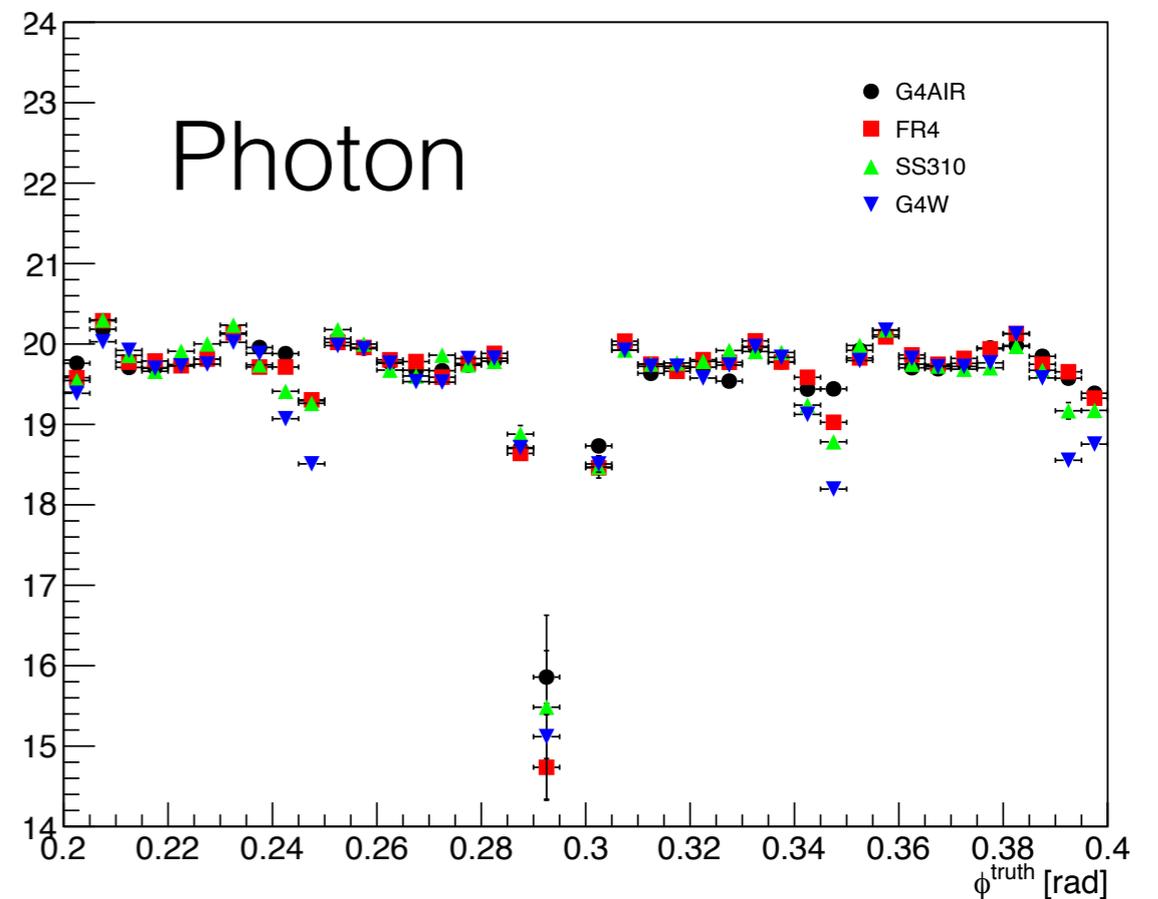

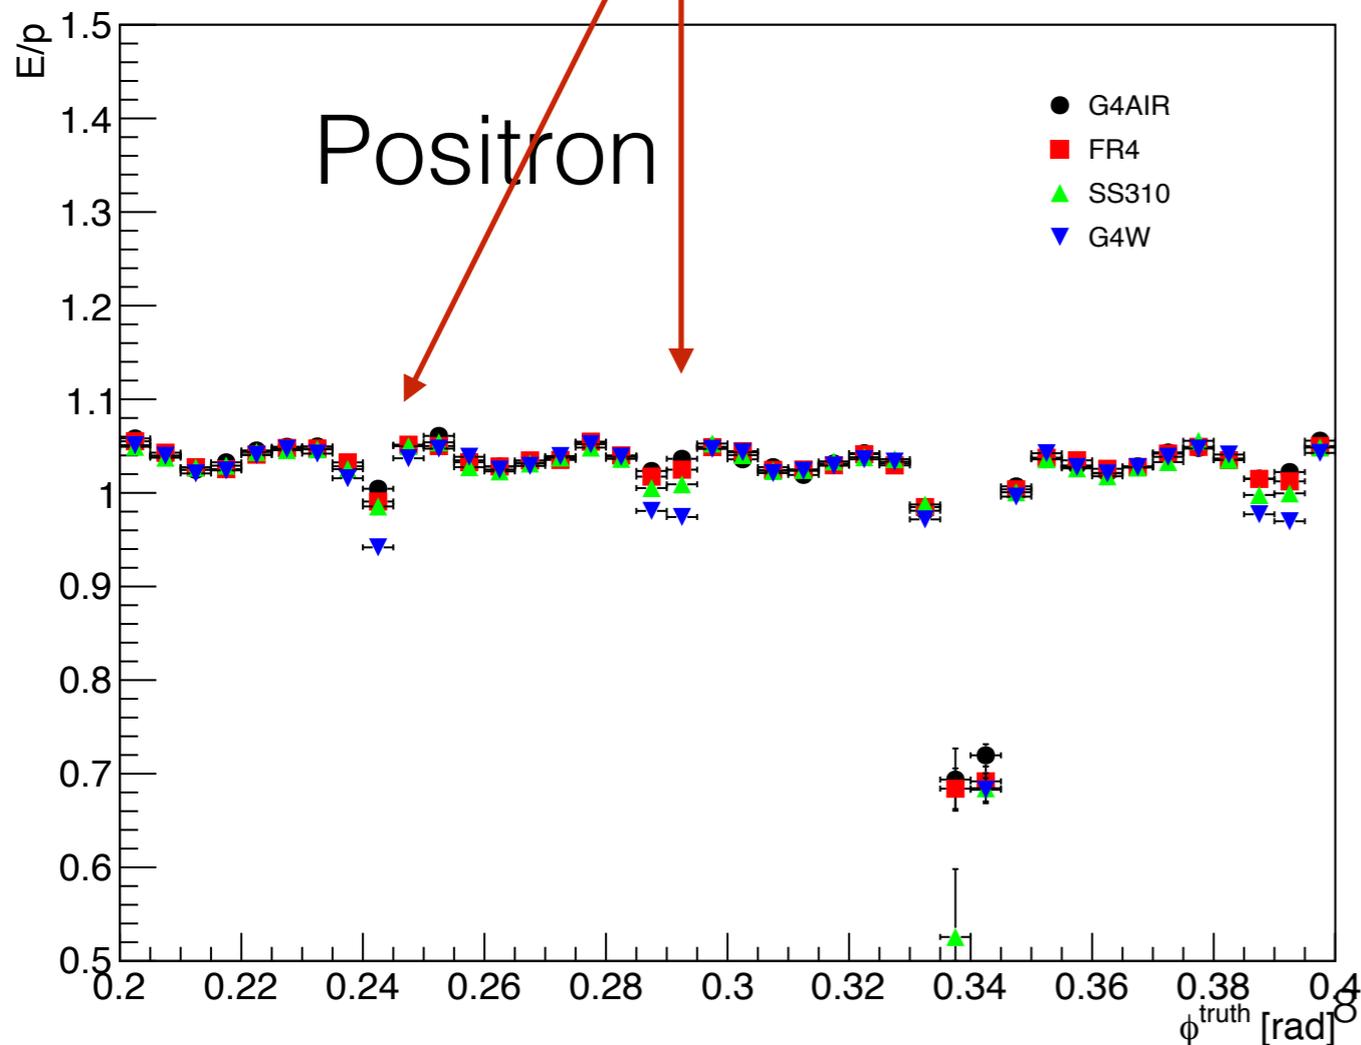

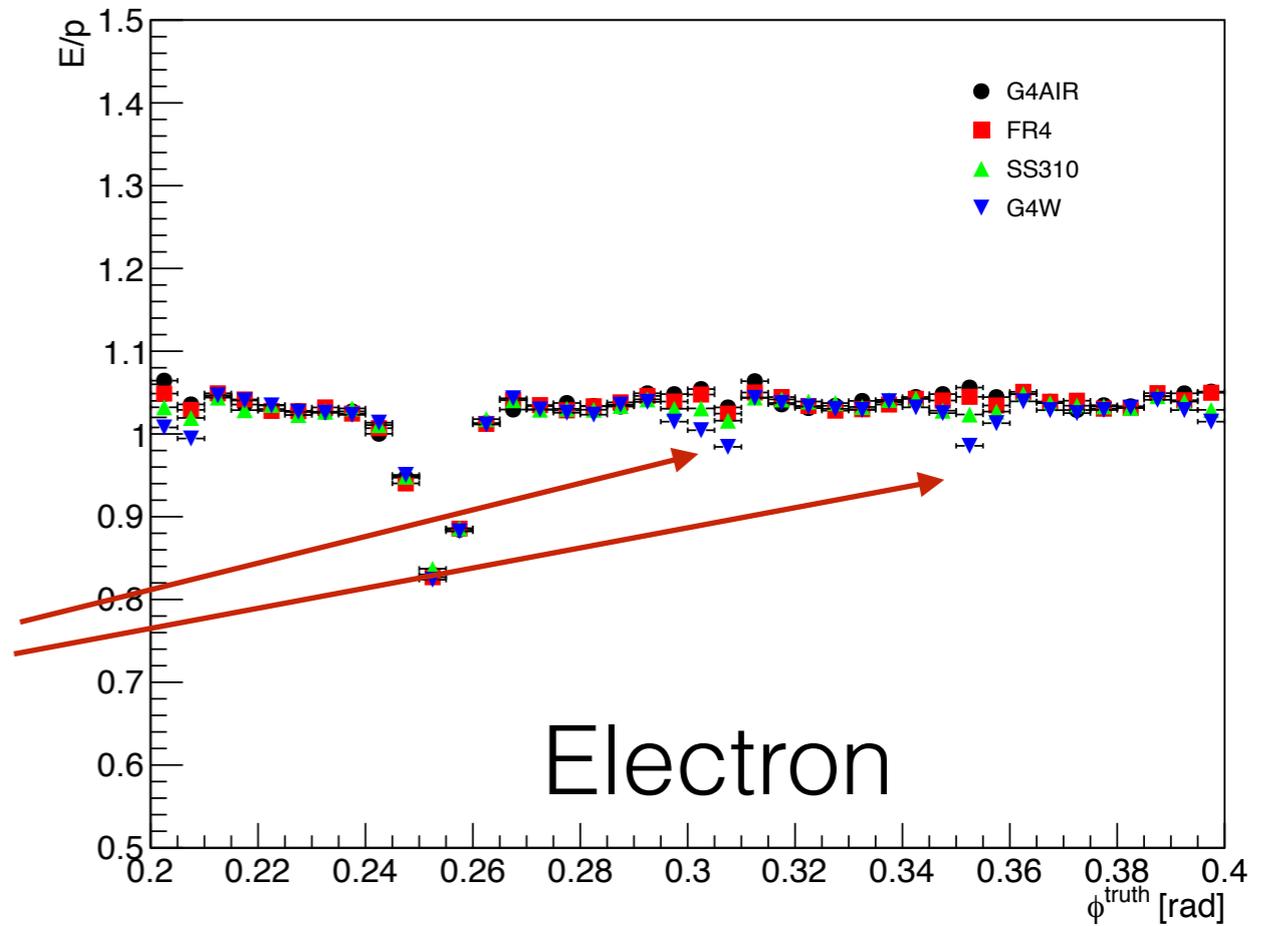

# Conclusions

- There is a slight response difference between the 4 materials
  - Looks to be an ~7% effect at worse from G4AIR-G4W, 3-4% effect at best
  - Difference between G4AIR and SS310 is at most 3%. Difference between SS310 and FR4 is at most 2%
  - Note also that the position dependent correction makes this difference smaller (see backups)

# Responses with Position Recalibration

Responses after position recalibration show some material dependence in block boundaries

# Example energy deposition in the divider per event [GeV]
